

If we want to support additional options:

The new flags :

Regex, count, filename

Then we would modify the grep :

```
grep_command="grep"  
[[ $case_sensitive != true ]] && grep_command+=" -i"  
[[ $use_regex == true ]] && grep_command+=" -E"
```

For -c

We let the grep handle counting with -c flag

For -l

We would just print the filename on first match & skip remaining line after the first match

The hardest parts to implement were to handle different options and pattern matching

Because the options are different and they should be handled in proper way and be ready for the unexpected behaviors.
